Processing Geodata using Python and Open Source Modules

Geodata ?

Geographic data and information are defined in the ISO/TC 211 series of standards as data and information having an implicit or explicit association with a location relative to the Earth.

Approximately 90% of government sourced data has a location component. <https://www.iso.org/committee/54904.html>

GIS – Geographic Information System

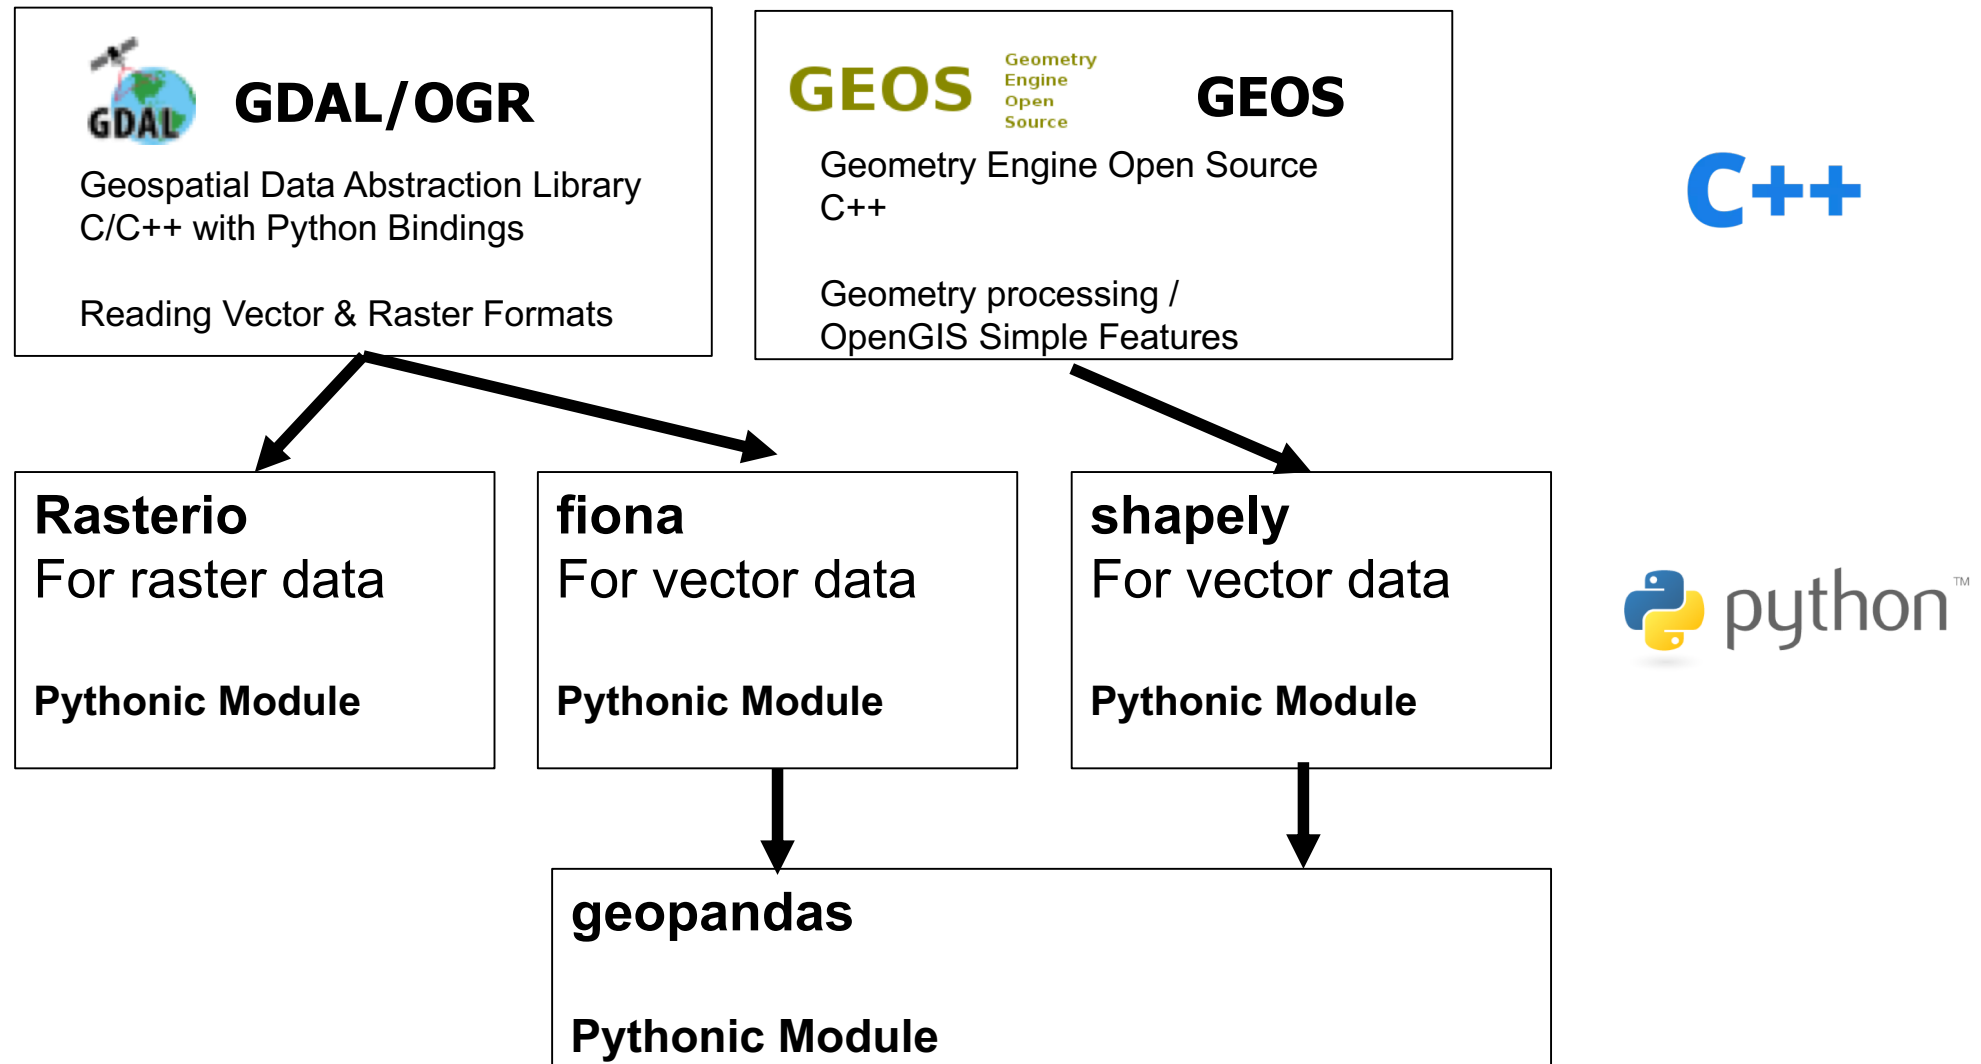

GIS is a system designed to **capture, store, manipulate, analyze, manage, and present** spatial or geographic data. Popular GIS are for example ArcGIS (ESRI) and QGIS – both can be extended by using Python.

Python ?

This talk will show you the basics of **manipulating, analyzing and presenting** geodata using Python (in the Jupyter Notebook.)

Important Open Source Libraries / Modules

Jupyter Notebook / Sample Data for this talk

GitHub

https://github.com/martinchristen/EP2018_Geo

Installation

https://github.com/martinchristen/EP2018_Geo

```
conda install shapely
```

```
conda install fiona
```

```
conda install rasterio
```

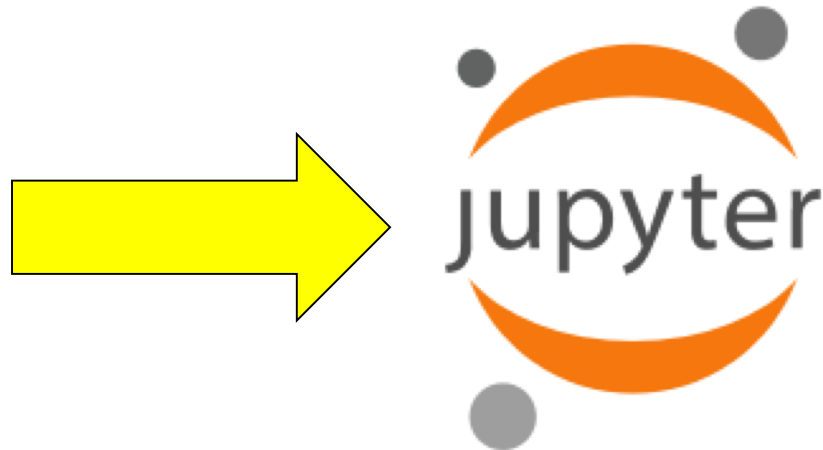

```
conda install geopandas
```

```
conda install folium -c conda-forge
```

Python 3.6 required

(3.7 doesn't support all Modules yet)
